HEART SCORE™

The Heart Score™ examination is a test designed to detect calcium deposits in the coronary arteries, which indicates the presence of plaque. While the CT Heart Score™ is very sensitive it cannot detect all coronary artery plaque in the heart. It can only detect plaque that has calcified.

The Heart Score™ test will give you two important pieces of information.

1. The **presence** or **absence** of coronary calcium in your heart.
2. The **degree** of coronary calcification in your heart.

If there is calcium present in your heart, the Radiologist will measure the volume and density of the calcium and he will determine your "calcium score". This score will show how you fit into various age and risk profiles and whether you have any likelihood of obstructive coronary artery disease. Scores may range from zero, representing no calcium observed, to more than 400, indicating the presence of significant calcium build-up. The result of your scan will be mailed to you within several days. If you would like, we can send a copy of the results to any other physician.

It is your responsibility to follow up any abnormal test results. We can assist you if you wish.

This test along with other indicators presents an overall picture of your heart health. Together, this will help you develop an appropriate heart health plan.

Clinical History
