CT LUNG CANCER SCAN

The CT Lung Cancer exam uses high speed computers to detect small details inside the lungs. This allows the radiologist to identify suspicious nodules and confirm the presence of cancer in its early stages. This scan is to identify abnormalities in the **lung only**, not abnormalities of the mediastinum, blood vessels or the heart.

You will receive the results of your Lung Cancer Screening test in the mail in several days. If you would like, we can send a copy of the results to any other physician.

It is extremely important to follow-up any abnormal test results either with us or another physician. Please understand that it is your responsibility to follow-up abnormal test results. We can assist you if you wish.

Smoking History

Present smoker — Number of packages per day_____
Number of years smoking _____

Past smoker — Number of packages per day_____
Number of years smoking _____

Asbestos exposure _____

Other comments _____
