About Your Mammogram And Our “**New Second Look**” CAD Technology

*At Radiology Group Imaging Center, we think your mammogram deserves a **Second Look**.*

Using computer-aided detection (CAD) technology, our new Second Look® system assists your radiologist in identifying potentially cancerous lesions.

When you receive your billing statement you will notice the new tool we’re using in our fight against breast cancer.

Computer-aided detection (CAD) uses a computer to analyze your mammogram. The computer does not replace the radiologist who would normally read your mammogram, it merely acts as a “second opinion” for your radiology physician. It alerts him or her to take a closer look at subtle warning signs that might easily be missed.

A Second Look without a second procedure

Second Look® CAD technology gives you the benefits of a second opinion without any addition procedures or doctor’s appointments. It is simply a part of the mammography reading process performed at Radiology Group.

Mammography is the best way to detect breast cancer

Mammography identifies a cancerous lesion in its earliest, most treatable stage - an average of 1.7 years before a woman can feel the lump. The sooner breast cancer is detected the better your chances of survival. The five-year relative survival rate when cancer is diagnosed at an early stage is 96.8%

If you have any questions about your mammogram or CAD technology, please feel free to ask for additional information from your technologist.
